

Includes essays by Nobel Laureate Dr. Norman E. Borlaug and other noted scientists and scholars. The modern environmental movement began with the publication of three seminal works, Rachel Carson's *Silent Spring*, Paul Ehrlich's *The Population Bomb*, and the Club of Rome's *The Limits to Growth*. These books' dismal visions of a poisoned, over-populated, resource-depleted world spiraling down toward environmental collapse are today's conventional wisdom. And every year we hear about new conclusive reports from special interest groups claiming that our atmosphere's temperatures are soaring, our air and water are more polluted, our cities are more crowded, and our global food supply is more precarious than ever before. However, according to a number of leading scientists from around the world, members of the environmental movement are guilty of twisting—sometimes manufacturing—the facts in an effort to frighten people into joining their cause. In this eye-opening book, some of the most respected researchers in the country explode the myths behind much of the doom and gloom of today's environmental movement. You will discover how the hysteria about global warming, overpopulation, mass extinctions, imminent famines, biotechnology, energy shortages, and more are grounded not in reason but in false science and a fear of progress. When placed beside the overwhelming facts, some of the most pervasive eco-myths crumble, including:

Myth: Antarctica is melting due to global warming—threatening to raise ocean levels
Fact: Antarctica has been cooling—and its glaciers thickening—for the past 30 years

Myth: The global population is growing faster than our ability to produce food
Fact: Global fertility rates are falling dramatically, and with advanced technology, farmers are producing more food using fewer resources than ever before

Myth: Solar- and wind-powered generators are a renewable, efficient, and less intrusive alternative to gas-, oil-, and coal-burning generators
Fact: Global fossil fuel supplies are in no near-term danger of being depleted, and a single 555-megawatt natural gas power plant produces more electricity than 13,000 windmills

Myth: Modern pesticides and fertilizers are increasing the rates of cancer in humans
Fact: No study has ever shown that anyone has developed cancer from the legal application of pesticides, and environmental pollution accounts for at most 2 percent of all cancer cases versus 30 percent caused by tobacco use

And many more

Ultimately, this book shows that uniting much of the environmental movement is an agenda that is not so much anti-pollution as it is anti-human. *Global Warming and Other Eco-Myths* lays out the true state of the planet, which, as you'll discover, is more healthy, vibrant, and clean than ideologically motivated environmentalists want you to believe.
