

Global Warming and Other Eco Myths: How the Environmental Movement Uses False Science to Scare Us to Death

Includes essays by Nobel Laureate Dr. Norman E. Borlaug and other noted scientists and scholars. The modern environmental movement began with the publication of three seminal works, Rachel Carsons Silent Spring, Paul Ehrlichs The Population Bomb, and the Club of Romes The Limits to Growth. These books dismal visions of a poisoned, over-populated, resource-depleted world spiraling down toward environmental collapse are todays conventional wisdom. And every year we hear about new conclusive reports from special interest groups claiming that our atmospheres temperatures are soaring, our air and water are more polluted, our cities are more crowded, and our global food supply is more precarious than ever before. However, according to a number of leading scientists from around the world, members of the environmental movement are guilty of twistingsometimes manufacturingthe facts in an effort to frighten people into joining their cause. In this eye-opening book, some of the most respected researchers in the country explode the myths behind much of the doom and gloom of todays environmental movement. You will discover how the hysteria about global warming, overpopulation, mass extinctions, imminent famines, biotechnology, energy shortages, and more are grounded not in reason but in false science and a fear of progress. When placed beside the overwhelming facts, some of the most pervasive eco-myths crumble, including: Myth: Antarctica is melting due to global warmingthreatening to raise ocean levels Fact: Antarctica has been coolingand its glaciers thickeningfor the past 30 years Myth: The global population is growing faster than our ability to produce food Fact: Global fertility rates are falling dramatically, and with advanced technology, farmers are producing more food using fewer resources than ever before Myth: Solar- and wind-powered

generators are a renewable, efficient, and less intrusive alternative to gas-, oil-, and coal-burning generators Fact: Global fossil fuel supplies are in no near-term danger of being depleted, and a single 555-megawatt natural gas power plant produces more electricity than 13,000 windmills Myth: Modern pesticides and fertilizers are increasing the rates of cancer in humans Fact: No study has ever shown that anyone has developed cancer from the legal application of pesticides, and environmental pollution accounts for at most 2 percent of all cancer cases versus 30 percent caused by tobacco use And many more Ultimately, this book shows that uniting much of the environmental movement is an agenda that is not so much anti-pollution as it is anti-human. Global Warming and Other Eco-Myths lays out the true state of the planet, which, as you'll discover, is more healthy, vibrant, and clean than ideologically motivated environmentalists want you to believe.

This is a list of scientists who have made statements that conflict with the scientific consensus on global warming as summarized by the Intergovernmental Panel on Climate Change and endorsed by other scientific bodies. .
